

**Project Design
Phase-I Solution
Architecture**

Team ID	PNT2022TMID07706
Project Name	Fertilizers Recommendation System For Disease Prediction
Maximum Marks	5 Marks

Solution Architecture:

- Crop disease in plants is predicted and suitable fertilizer is recommended for better yield. The images of the diseased plants are obtained and it is preprocessed against the dataset of diseased plants.
- Agriculture is the most important sector in today's life. Most plants are affected by a wide variety of bacterial and fungal diseases.
- Deep Learning Algorithm is used to process the images and then it is evaluated. Then a model is built on the evaluations, it is then trained using no. of inputs and predictions are given to the users which subsequently helps in recommending the fertilizers.
- The Convolutional layers are used to classify and process the images and further helps in recommending the fertilizers. The image classification steps are:
 - Image acquisition
 - Preprocessing
 - Segmentation
 - Disease prediction
 - Fertilizer Recommendation
